

Image Capture Station

The light shield eliminates the need for extra lighting or equipment. Simply place the new medication on the background platform, click the mouse, and the image is automatically uploaded to the AMS or workflow software database.

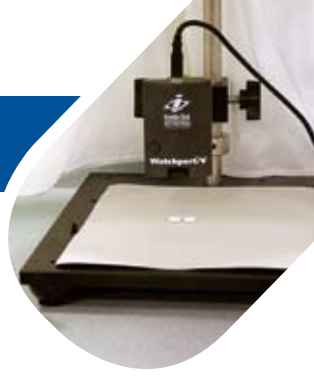

Image Capture Station heightens medication safety, by coupling barcodes and product images.

The simplest way to capture and store every medication on your formulary

An RxWorks™ Suite Solution

The Image Capture Station is one of the RxWorks Suite technology and consulting solutions which optimize the medication management process and enable improved patient care, increased cost savings, and market growth opportunities.

Product images and barcodes go hand-in-hand

Two major safeguards in dispensing medications in the pharmacy are product barcodes and product images. At every step in the pharmacy—from dispensing to labeling to pharmacist checking—product images and barcodes are used to ensure the right patient receives the right medication. Since off-the-shelf software does not provide images for all medications, the Image Capture Station is the most accurate, economical and easiest tool to manage this important process.

Complete image catalog for your entire inventory

With the Image Capture Station, you can take a digital image of every dosage form in your formulary—oral solid, unit of use, injectible, and so on. As medications are added or changed, you can easily capture and store the new images in the medication database.

Easy to learn, easy to use

The Image Capture Station requires no photography skills or training. In less than 15 minutes, the Image Capture Station is set up and ready to use; and new images take less than 10 seconds to capture. The unit nestles into any spare countertop corner. The camera is always poised to capture new medications at the click of a mouse. The color images are automatically uploaded to the database to ensure the image is accurately associated with the medication.
